

I totally support the ARRL Docket ET03-104. Enactment of 03-104 would violate existing non-interference FCC regulations dealing with the 2Mhz to 80Mhz frequency range. In addition render that frequency range nearly unuseable, by the Amateur Radio Service which has in the past, been called upon to provide supplemental emergency communications for public safety agencies. Also in light of the importance the Department of Homeland Security seems to place on the Amateur Radio Service, tinkering with 2Mhz-80Mhz frequencies for use on an untested, unproven, system, seems to me to be illadvised.
